

Dual sensing Bay-O-Net fuse link

General

Eaton protects both distribution apparatus from damaging currents and to protect distribution systems from failed apparatus with its Cooper Power series dual sensing Bay-O-Net fuse link that is used in Eaton's Cooper Power series Bay-O-Net fuse assemblies (see *Catalog CA132015EN Sidewall-Mounted and Cover-Mounted Bay-O-Net Fuse Assembly*).

Dual sensing links sense not only secondary faults, excessive load currents and transformer faults, but also transformer fluid temperature. They will limit long-term transformer heating caused by overloads and high temperature environments.

Application

Bay-O-Net fuses can be used on single-phase conventional and self-protected distribution transformers and on three-phase equipment.

Its ideal use is in a two-fuse protection scheme with a current-limiting backup fuse. In this arrangement, secondary faults and overload currents are cleared by the Bay-O-Net fuse, and high level faults are cleared by the current-limiting fuse. The two fuses are connected in series, and are coordinated so that the current-limiting fuse operates only upon internal equipment failure. (See *Catalog CA132013EN ELSP Current-Limiting Backup Fuse* to order an ELSP current-limiting backup fuse.) If the bayonet fuse will not be used in series with a current-limiting fuse, an isolation link is required. (See *Catalog CA132012EN Isolation Link*.)

Bay-O-Net fuses are comparable in cost to internal cartridge fuses but have the advantages of being field-replaceable. Bay-O-Net fuses can easily be coordinated with upstream devices.

Installation

No special tools are required. A hotstick is used to remove the Bay-O-Net fuse cartridge holder from non-pressurized apparatus. The fuse cartridge is then replaced, and the holder reinserted using a hotstick. Refer to *Service information MN132002EN Bay-O-Net Fuse Re-Fusing Installation Instructions* for re-fusing instructions.

140	4000358C18CB**

* Add suffix "B" to order individual fuse; add "M" to order bag of 50.

** Catalog number is an integral element/cartridge/end plug design.

Ordering information

To order a dual sensing Bay-O-Net fuse link, determine the requirements of the application from Tables 3 and 4 and specify the fuse required from Table 2.

Method A

Using the correlation tables

Use the following correlation information (Tables 3 and 4) to complete Catalog Number 4000358__.

For 19.9 kV single-phase and 34.5 kV three-phase applications, an ELSP current-limiting backup fuse is recommended. (See Catalog CA132013EN for more information).

If the Bay-O-Net link is not used with a current-limiting fuse, an isolation link is required. (See Catalog CA132012EN).

Correlation is based on IEEE Std C57.92™-1981 standard, Loading Guide, IEEE Std C57.109™-1993 standard, Through-Fault Guide, and Reference Data TD132001EN Pad-Mounted Transformer Fusing Philosophies.

1000	–	–	–	C18	C14 ^a	C14 ^a	C14 ^a	C12 ^a	C12	C12
1500	–	–	–	–	C18 ^c	C18 ^c	C18 ^c	C14	C14	C14

Note: Recommendations are based on 200% transformer loading for 2 hours, 160% loading for 7 hours and thermal characteristics of typical Eaton's Cooper Power series transformers. Recommended fuses meet inrush requirement of 12 times transformer full load current for 0.1 second. Bay-O-Net fuse links alone should not be used at voltages greater than 17100 V for delta configurations or 24940 gnd Y/14400. For applications through 23 kV delta or 34500 gnd Y/19920, a 23 kV rated ELSP fuse (Catalog CA132013EN) is recommended in series with the Bay-O-Net link. Do not use fuse links 4000358C16CB or C18CB for voltages greater than 8320 V for delta configurations or 14400 gnd Y/8320.

a. Recommended fuse will result in some loss of overload capacity.

b. Recommended fuse limited to gnd Y/gnd Y transformer with less than 50% delta loading.

c. Recommended fuse limited to gnd Y primary.

d. For voltages greater than 17100 V for delta configurations or 24940 gnd Y/14400 and through 23 kV delta or 34500 gnd Y/19920, an ELSP 23 kV rated current-limiting back-up fuse (Catalog CA132013EN) in series with the Bay-O-Net fuse link is recommended.

Method B

Using time-current curves

To determine or confirm the dual sensing Bay-O-Net fuse that will coordinate with upstream and downstream system requirements, use time-current characteristic curves and specify the fuse indicated from Table 2.

Long term overload curves for selected transformer ratings are also available.

For full size TCC curves R240-91-51, long term overload curves and further information regarding either of these ordering methods, contact your Eaton representative.
